

HyperV Migration

A **Southern California city** asked the engineers at Abtech to migrate them quickly and efficiently from their **Microsoft HyperV environment** to a more efficient **VMware** profile.

A **major medical services provider** in mid-California asked Abtech to recommend a virtual server solution running on Dell servers and storage. This was installed and configured by our engineers and integrated within their existing network. The project included three further phases to implement a **backup solution** using Veeam, migrate Exchange to 2019, and replace their existing 1Gb switches with 10Gb switches.
